## **New Mexico- Portales Field Office** FY 2003 Ranking Criteria Worksheet - Irrigated Cropland Total Points: Applicant: Date: Tract No.: Farm No.: CMS Field No's. 1. Water Quantity - 165 Potential Points (30% of Total) Irrigation Efficiency - Use FIRS to Evaluate Potential Benchmark After % of Area in Contract % of Area in Contract After **Points** Points **Points** before Treatment Efficiency Treatment 0 1-20% 21-30% 25 31-40% 50 75 41-50% 51-60% 100 61-70% 125 71-80% 145 >80% 165 1. Water Quantity **Total** 0 2. Water Quality - 110 Potential Points (20% of Total) A. Surface Water Pollutants - 55 Points Maximum There is a probability that runoff water from irrigated fields contains sediment, salt, pesticides, and/or nutrients (or other associated chemicals). Treatment is needed to prevent these pollutants from entering live waters, or re-entering a shared irrigation system. Points will be awarded based on distance from the end of field to the nearest live waters or re-entry point into a shared irrigation system. If there is no run-off, after points will be 0. Distance of Surface runoff to Live Water **Points** After <100 Ft. 55 101 - 500 Ft. 40 501 - 1,320 Ft. 30 1,320 - 2,640 Ft. 20 >2,640 Ft. 0 Total A. Surface Water 0 B. Ground Water Pollutants - 55 Points Maximum There is a probability that irrigation water containing salt, pesticides, and/or nutrients (or other associated chemicals) is leaching into the ground water. Treatment is needed to prevent these pollutants from contaminating ground water, through leaching and direct return flow into wells. Points to be awarded based on depth to the water table, or Depth to Water Table Points After 1 - 10 Ft or elimination of any direct discharge into ground water. 55 10 - 50 Ft. 35
